Reading: Chapter 2 in the prescribed textbook

Outline

- **Application Architecture**
 - **Application Layer Services**
 - The Web <https://eduassistpro.github.io/>
 - Email: SMTP, POP [Add WeChat edu_assist_pro](#)
 - Other Application-Layer Protocols
-

Application Layer

What is a network application?

Is a program that:

- run on (different) *end systems*
- communicate over network

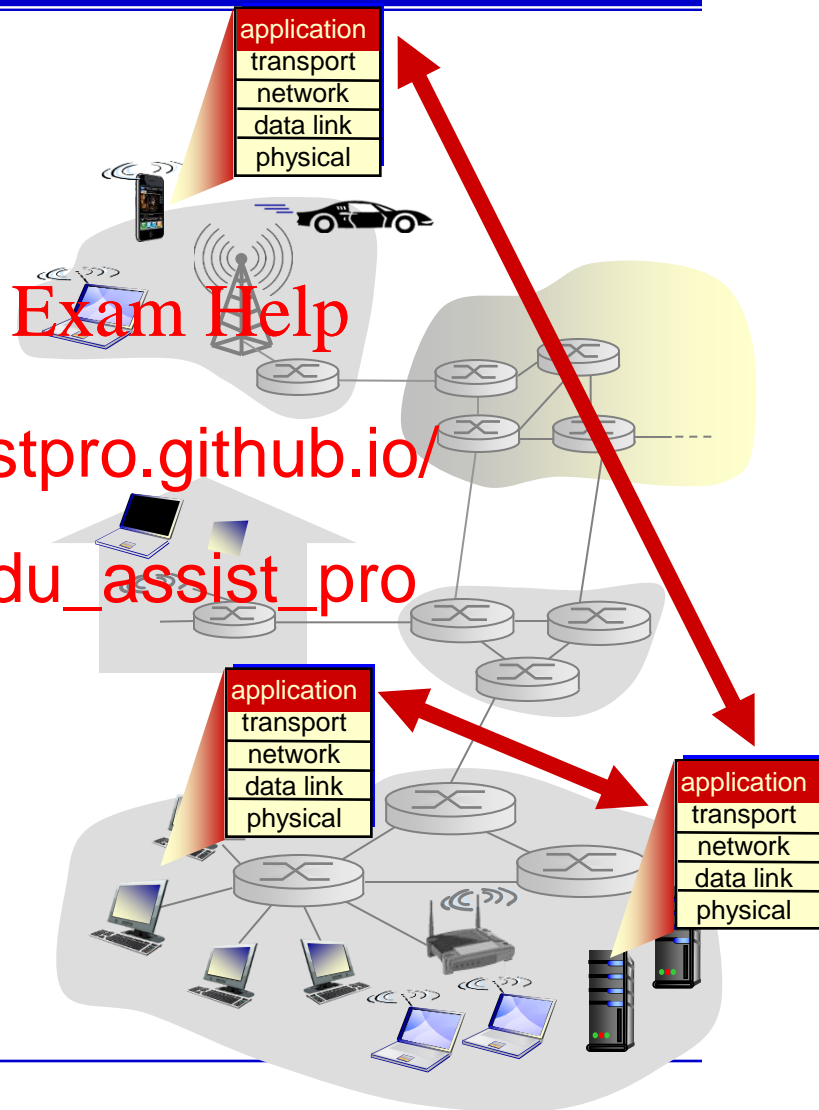

no need to write for network-

- network-core devices do not run user applications
- applications on end systems allows for rapid app development, propagation

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Application Architecture

- The way the functions of the application layer are spread out across **the client** and **the server**

- Four components of applications:
 1. Data Stor <https://eduassistpro.github.io/>
 2. Data Access Logic
 3. Application Logic
 4. Presentation Logic

Assignment Project Exam Help

Add WeChat edu_assist_pro

Application Architectures

- Who is doing what between the clients and servers?

- **Host-based** Architectures

- Server performs almost all functions

- **Client-based** architectures

- Client performs almost all functions

- **Client-server** architectures

- Functions shared between client and server (including **Cloud Computing**)

- **Peer to peer** architectures

- Computers are both clients and servers

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Host-Based Architecture

- Common in the 1960s with mainframes and terminals
- Server contains all components (server-based)

CLIE

RVER

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Presentation Logic
Application Logic
Data Access Logic
Data Storage

Host-Based Architecture

- **Advantages**

- Very simple

- Single point of failure

- **Disadvantages**

- Host (server) can become a bottleneck

- Upgrades typically expensive ('lumpy architecture')

Client-Based Architecture

- Most common in the 1980s with popularity of PC
- Client contains presentation, application, and data access logic while server stores the data

Assignment Project Exam Help

CLIE

RVER

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Presentation Logic
Application Logic
Data Access Logic

Data Storage

Client-Based Architecture

- **Advantages**

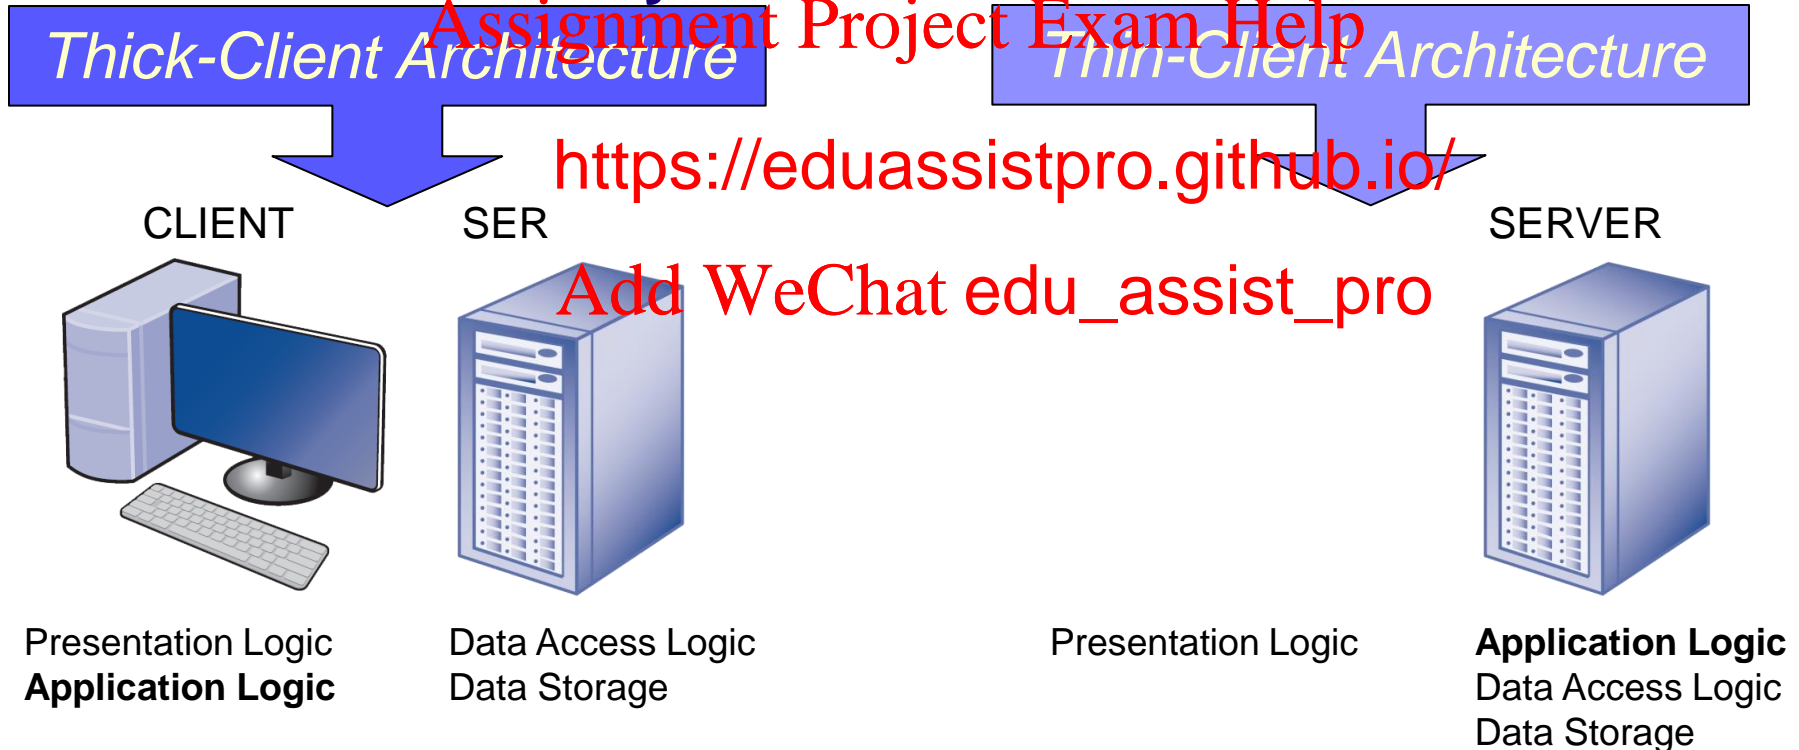

- Hardware and applications less expensive
- Simple arc

- **Disadvanta**

- Data must travel back and forth between server and client

Client-Server Architecture

- Most common architecture today
- Thin clients are easier to manage, thick clients have more functionality

Client-Server Architecture

- **Advantages**

- More efficient because of distributed processing
- Allows hardware/software from different vendors to
- Less bandwidth required

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

- **Disadvantages**

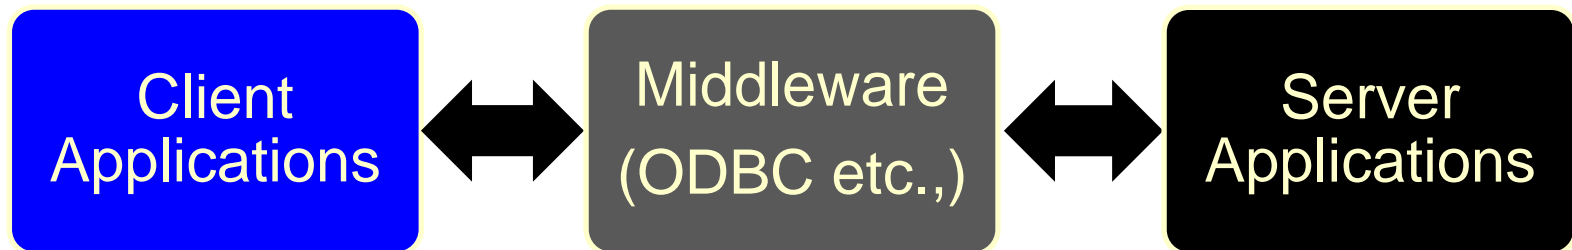

- May be challenges in configuring hardware/software from different vendors to work together
 - In many cases, middleware is required
-

Client-Server Architecture

Middleware is software acts as an intermediary by “**sitting between**” client and server applications

1. Provides a standard way of translating between software from

2. Manages changes from the clients (updates network, adding a new server)

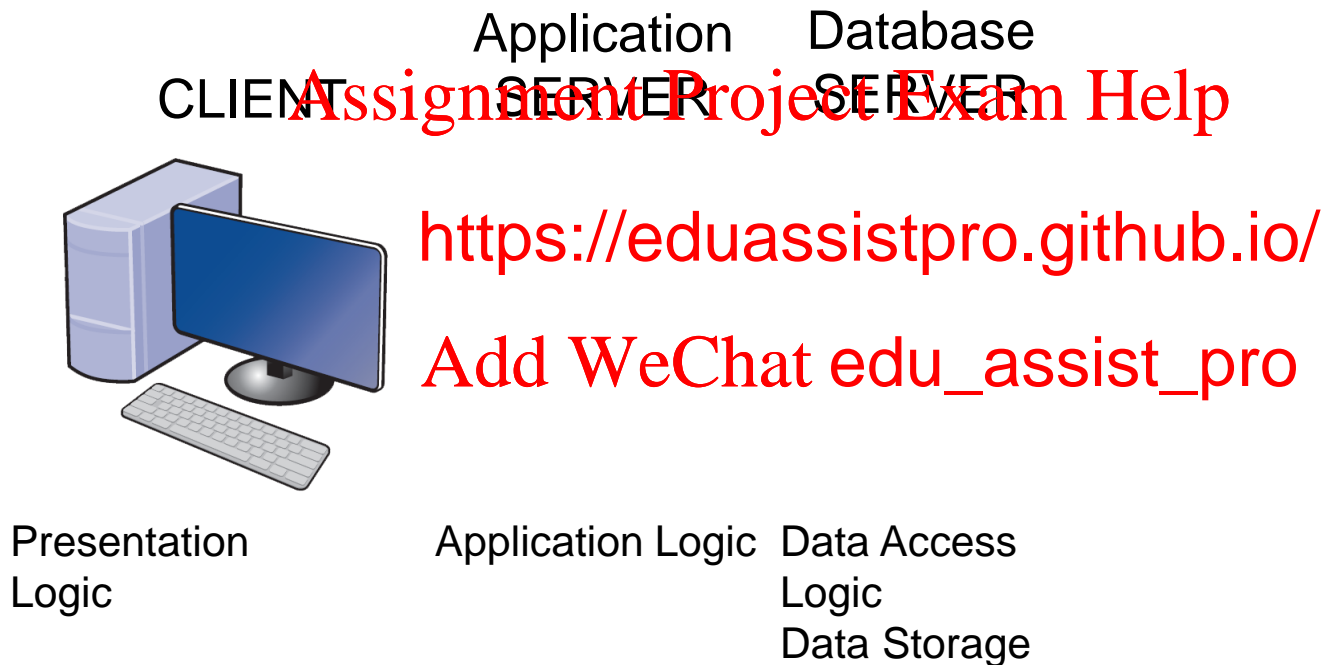

Client-Server Architecture

- Example of **two-tier** architecture

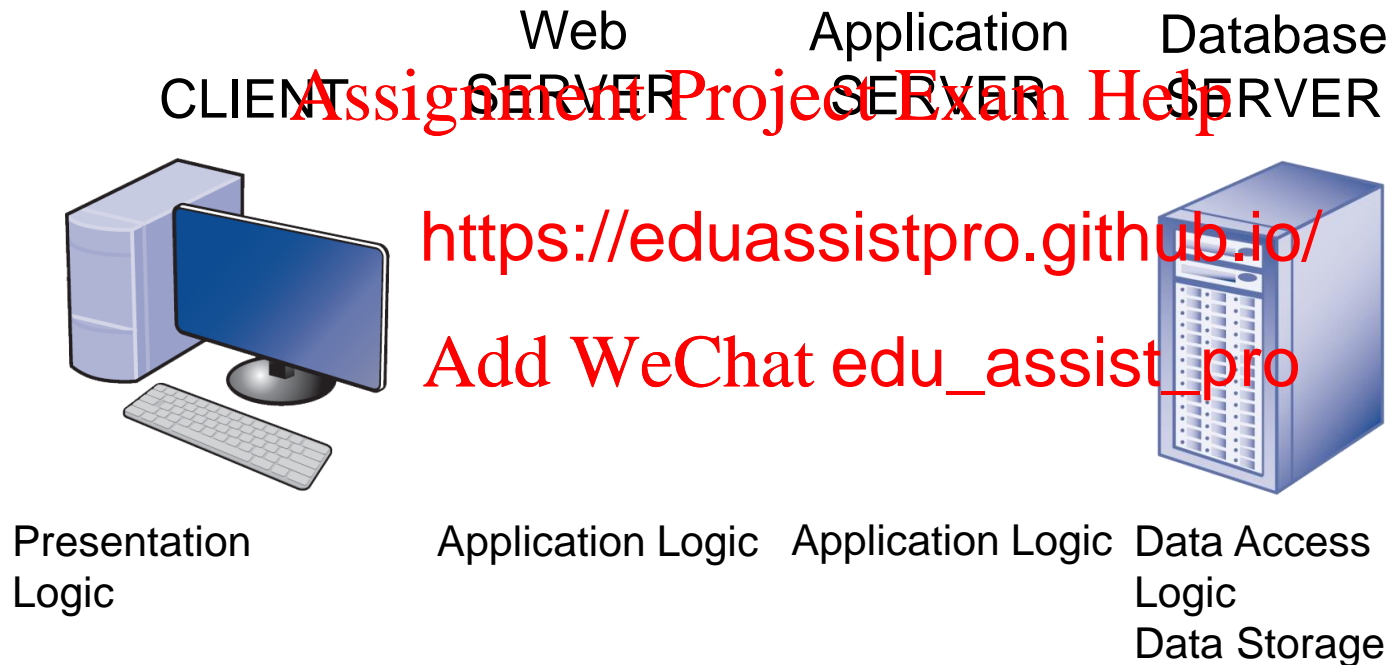

Client-Server Architecture

- Example of three-tier architecture

Client-Server Architecture

- Example of n-tier architecture

Tiered Client-Server Architecture

- **Advantages**

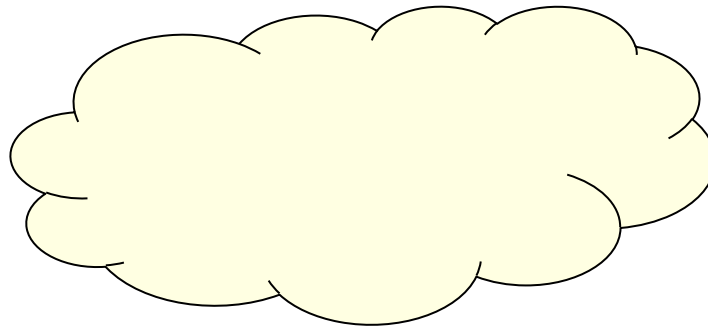

- Better load balancing: More evenly distributed processing
- More scalable: Only servers experiencing high demand need be upgraded

- **Disadvantages**

- Heavily loaded network: More data exchanged processing necessitates more data exchanged
- Difficult to program and test due to increased complexity

Cloud Computing

- Cloud Computing is the general term for enabling **access to computing services over the network** (most commonly the Internet)
- Models of **cloud computing** are those in which a **cloud provider** manages each application and associated hardware/s

Case Study: Building a Business

OLD WAY

- Significant Upfront Investment
- Results in months
- Large total investment

CLOUD WAY

- No Upfront investment
- Results in days
- Small total investment

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Cloud Computing: Key benefits

- **Huge Resources**

- Available for everyone with a small fee
- Leasing model compared to buying model

- **No Commit**

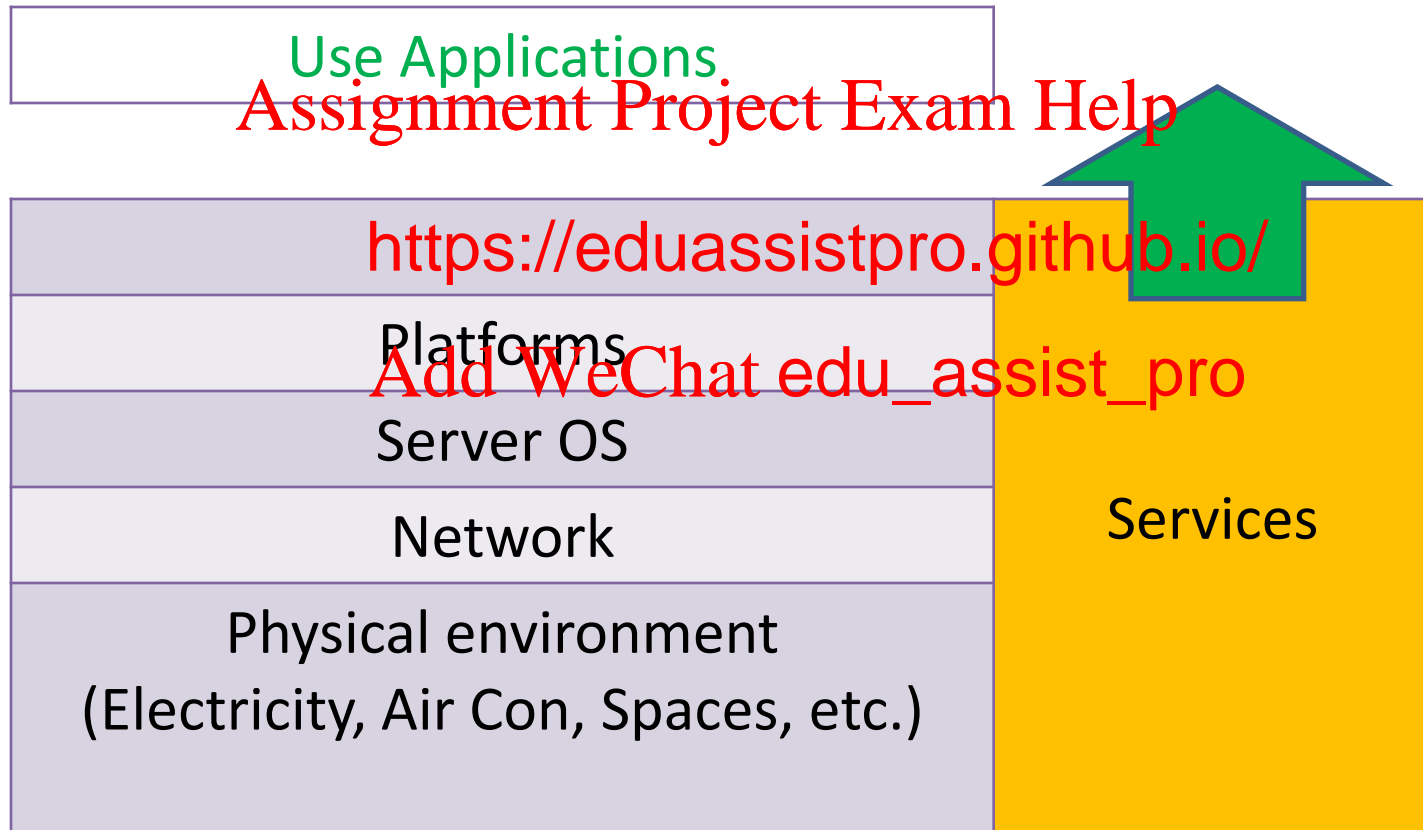

- No over provisioning (capital)
- No under provisioning (servers)

- **Pay by use**

- Pay only for actual resources consumed
-

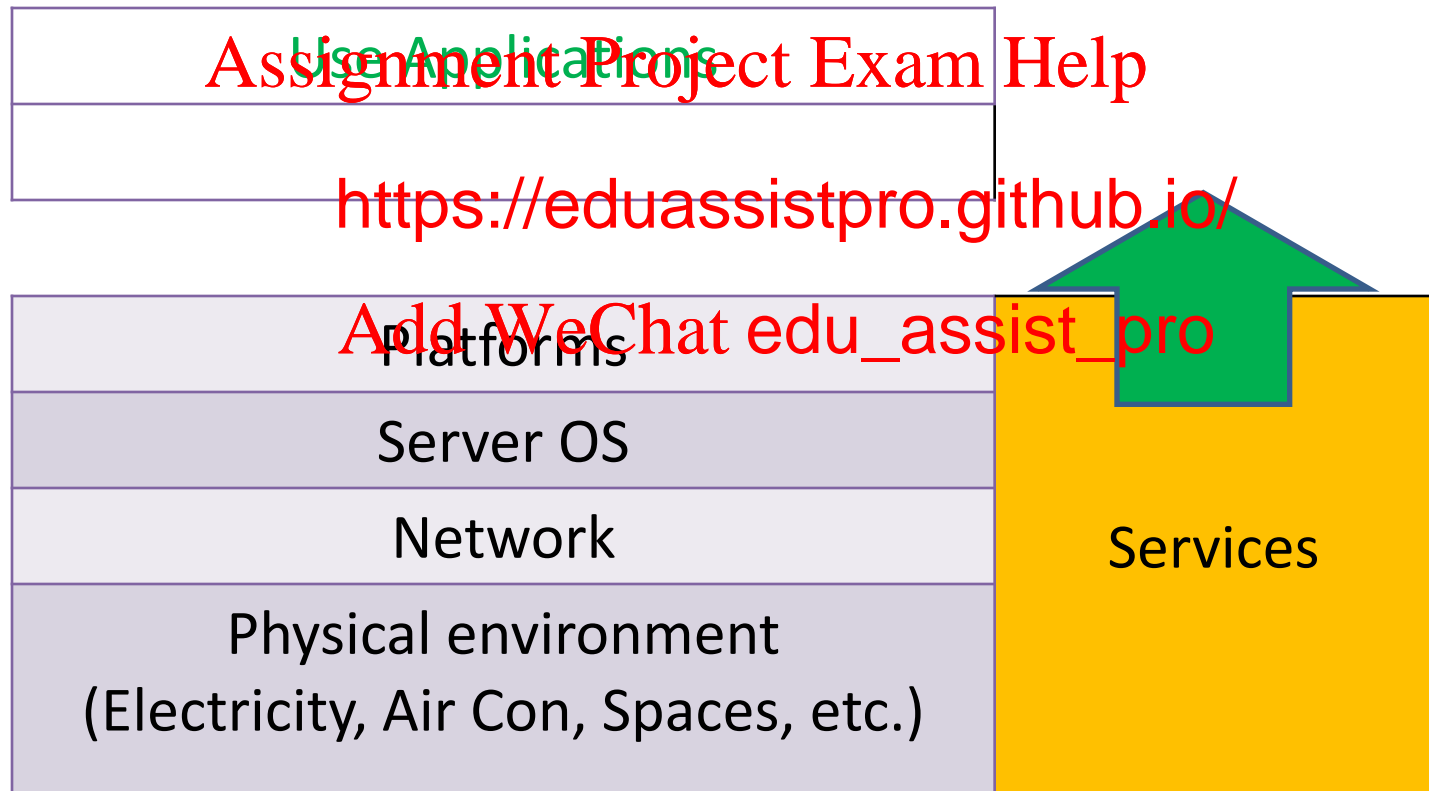

Software as a Service (SaaS)

- Provides all application components and associated hardware/software

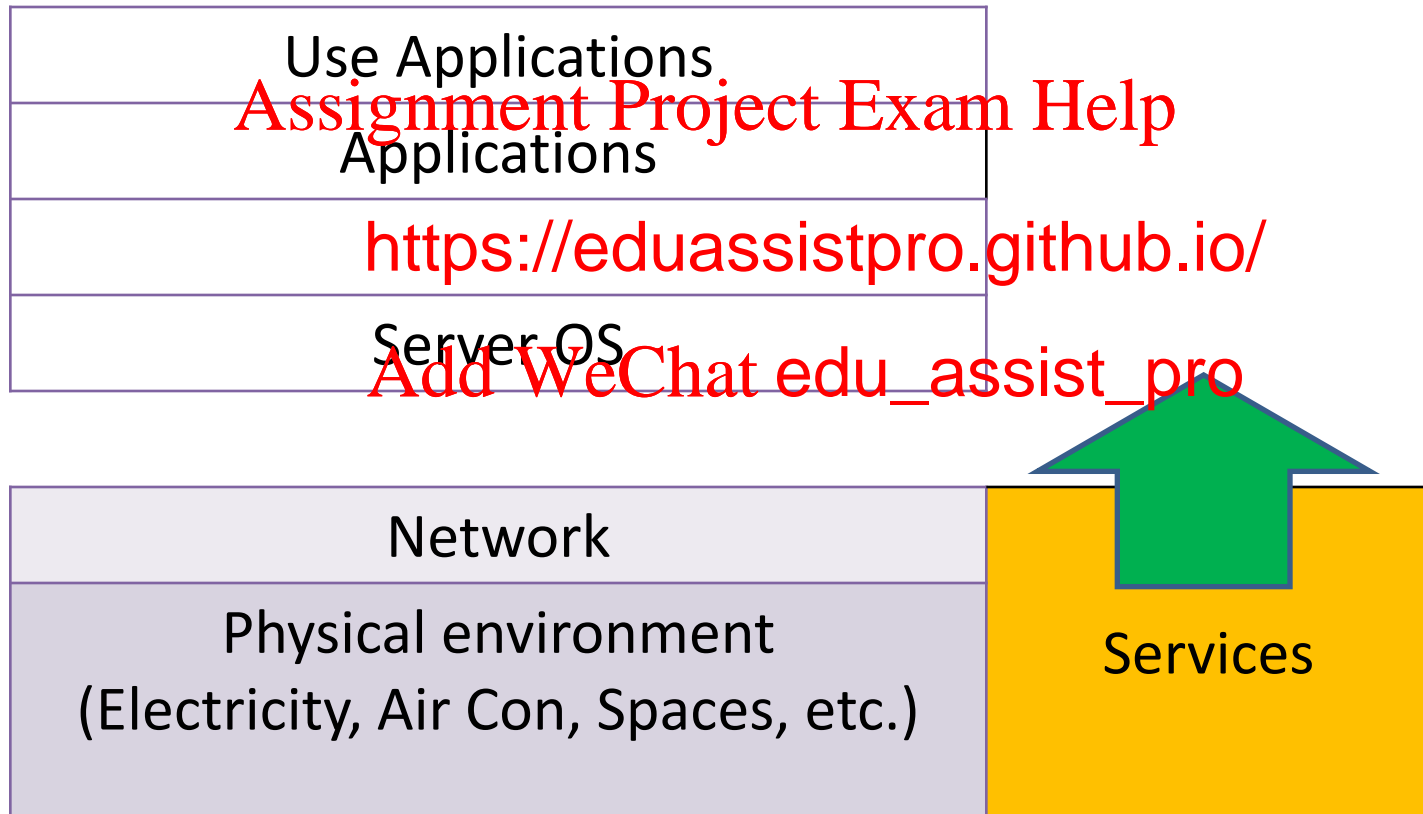

Platform as a Service (PaaS)

- Provides computing platforms (OS, database, webserver etc.,)

Infrastructure as a Service (IaaS)

- All hardware is outsourced

Cloud Computing Delivery

Data Storage

Presentation Logic
Application Logic
Data Access Logic
Data Storage

Peer to Peer Architecture

- **Advantages:**
 - Data can be stored anywhere on the network
 - Very resilient to failure
 - Distributed
- **Disadvantages:**
 - Finding the stored data (no centralised control)
 - Security (everything is everywhere)

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Criteria for Choosing Architecture

- **Development Costs**

- Tools, Software packages etc.,
- Cost of servers, clients, and networks (infra, platform)

- **Scalability**

- Ability to increase (or decrease) in computing capacity as network demand changes
- Easier in client-server architectures

- **Reliable**

- Ability to recover from failures
-

Outline

- **Application Architecture**
 - **Application Layer Services**

 - **Other Application-Layer Protocols**
-

Web and HTTP

First, a review...

- **web page** consists of **objects**
- object can be HTML file, JPEG image, Java applet, and <https://eduassistpro.github.io/>
- web page consists of **several** **objects**
- each object is addressable by a **URL**, e.g.,

`www.someschool.edu/someDept/pic.gif`

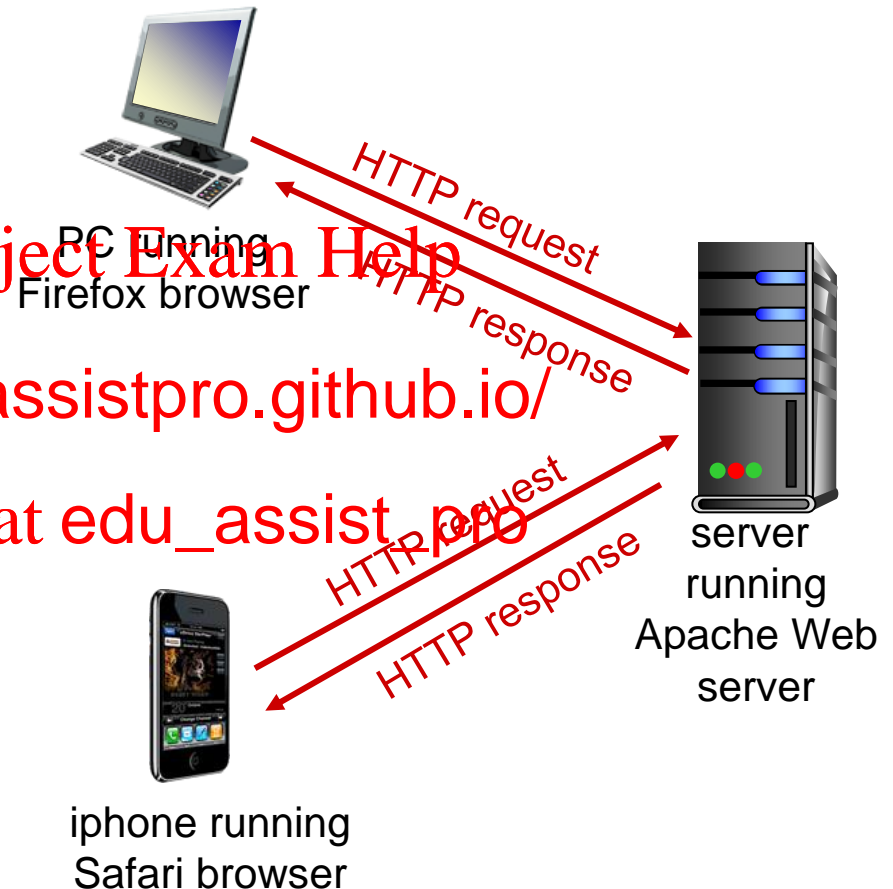

host name

path name

HTTP Overview

HTTP: hypertext transfer protocol

- Web's application layer protocol
- client/server
 - **client:** browser requests, receives, (using HTTP protocol) and "displays" Web objects
 - **server:** Web server sends (using HTTP protocol) objects in response to requests

HTTP Overview

uses TCP:

- client initiates TCP connection (creates socket) to server, port 80
- server accepts connection from
- HTTP message (application-layer protocol messages) exchanged between browser (HTTP client) and Web server (HTTP server)
- TCP connection closed

HTTP is “stateless”

- server maintains no information about past client requests

Assignment Project Exam Help

<https://eduassistpro.github.io/> — aside

Is that

Add WeChat [edu_assist_pro](https://eduassistpro.github.io/) are complex!

- ❖ ry (state) must be maintained
- ❖ if server/client crashes, their views of “state” may be inconsistent, must be reconciled

HTTP Connections

non-persistent HTTP

- at most one object sent over 1 connection
 - connection then closed
- downloading multiple objects required multiple connections

persistent HTTP

- multiple objects sent over TCP connection client, server

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Non-persistent HTTP

suppose user enters URL:

`www.someSchool.edu/someDepartment/home.index`

(contains text,
references to 10
jpeg images)

1a. HTTP client initiates TCP

connection to HTTP server
(process) at

`www.someSch`
port 80

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

HTTP server at host
`meSchool.edu` waiting
connection at port 80.
s connection, notifying

2. HTTP client sends HTTP request

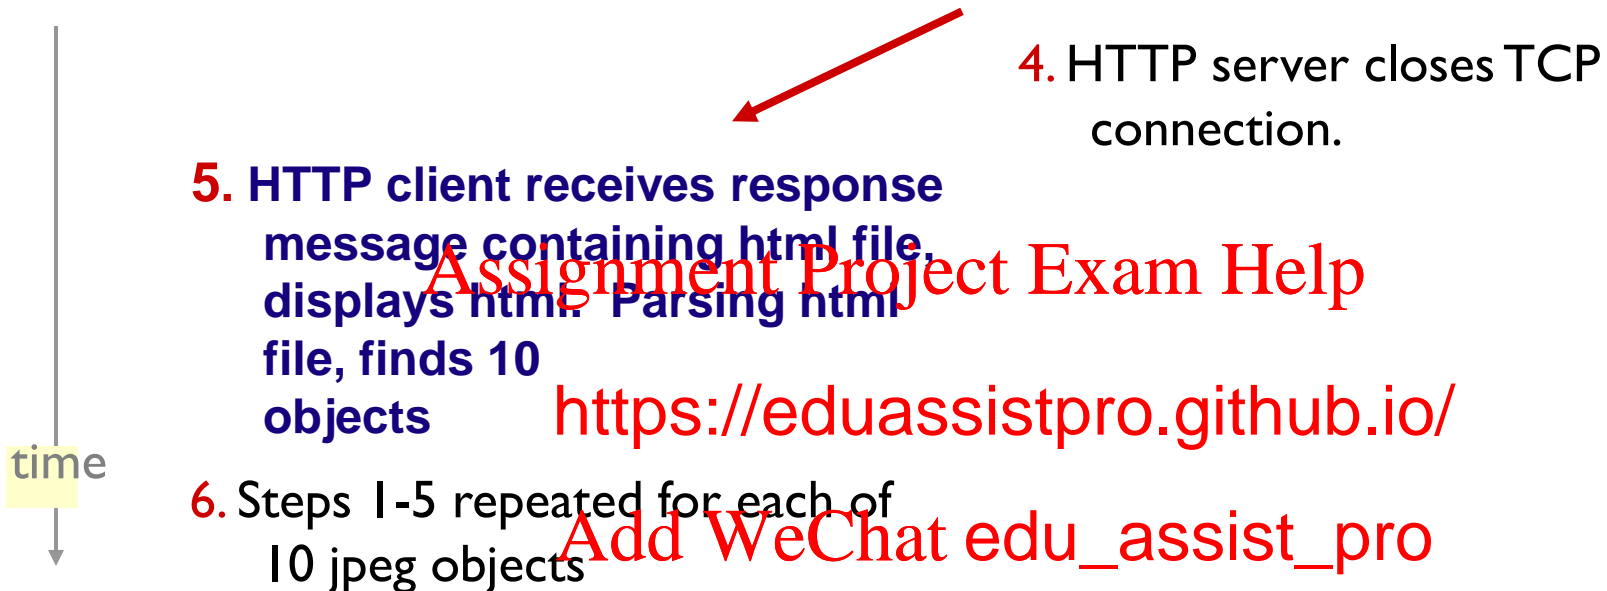

message (containing URL) into
TCP connection socket.

Message indicates that client
wants object
`someDepartment/home.index`

3. HTTP server receives request
message, forms response
message containing requested
object, and sends message into
its socket

time

Non-persistent HTTP

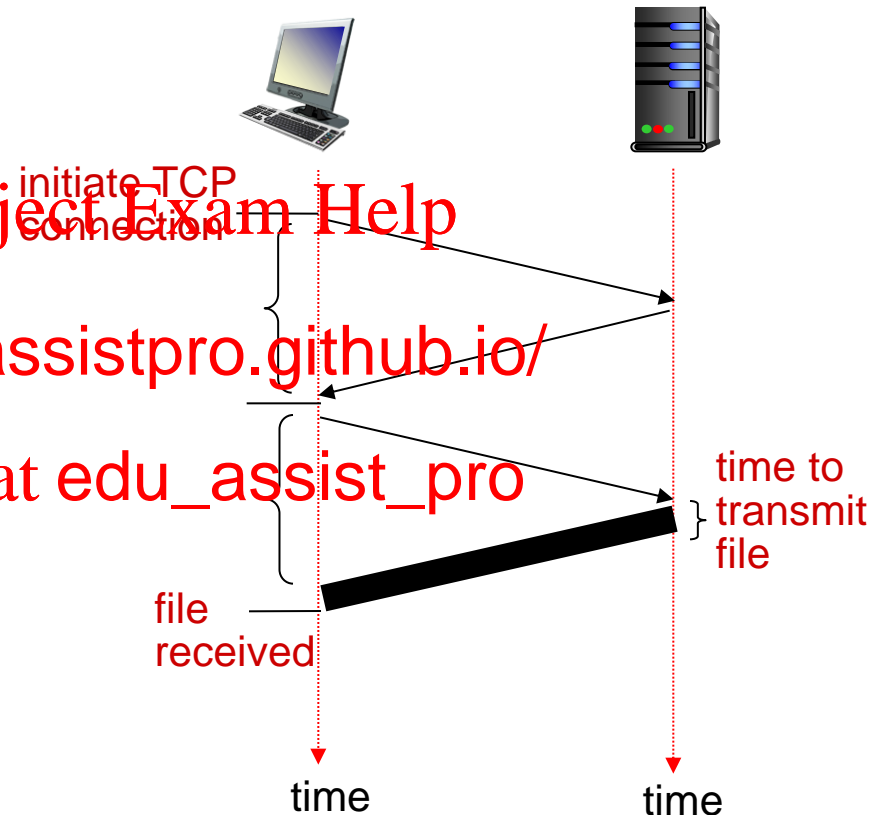

Non-persistent HTTP: response

RTT (definition): time for a small packet to travel from client to server and back

HTTP response time:

- one RTT to initiate TCP connection
- one RTT for HT and first few bytes of HTTP response to return
- file transmission time
- non-persistent HTTP response time =
 $2\text{RTT} + \text{file transmission time}$

Persistent HTTP

non-persistent HTTP

issues:

- requires 2 RTTs per object
- OS overhead for connection
- browsers often open parallel TCP connections to fetch referenced objects

persistent HTTP:

- server leaves connection open after sending response
- subsequent HTTP requests between same connection
• client sends requests as soon as it encounters a referenced object
- as little as one RTT for all the referenced objects

Add WeChat edu_assist_pro

HTTP Response: status codes

- ❖ status code appears in 1st line in server-to-client response message.
- ❖ some sample codes:

200 OK Assignment Project Exam Help

- request successful, status code appears later in this msg

301 Moved <https://eduassistpro.github.io/>

- requested object moved, location specified later in this msg (Location:)

400 Bad Request

- request msg not understood by server

404 Not Found

- requested document not found on this server

505 HTTP Version Not Supported

Email

- **Mail User Agent (MUA): Mail Client**
 - Formal name for mail client software
 - e.g., Outlook, Apple Mail, Thunderbird
- **Mail Transfer Agent (MTA): Mail Server**
 - Formal name for mail server software
 - e.g., Sendmail
- **Simple Mail Transfer Protocol (SMTP)**
 - Protocol used to send a message
 - Originally only handled text files
- **Internet Message Access Protocol (IMAP) or Post Office Protocol (POP)**
 - Protocols used by a MUA to retrieve messages from an MTA

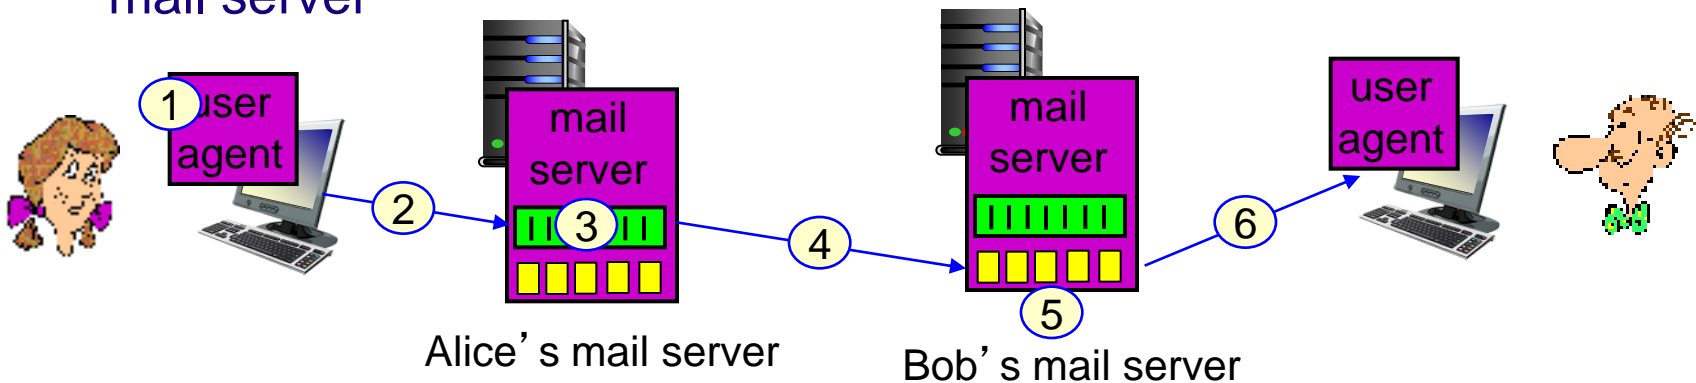

Email in Action

- 1) Alice uses MUA to compose message "to" bob@some school.edu
- 2) Alice's MUA sends message to her mail server, message placed in **message**
- 3) client side of SMTP TCP connection with Bob's mail server
- 4) SMTP client sends Alice's message over the TCP connection
- 5) Bob's mail server places the message in Bob's **mailbox**
- 6) Bob's mail server notifies his user agent to retrieve message

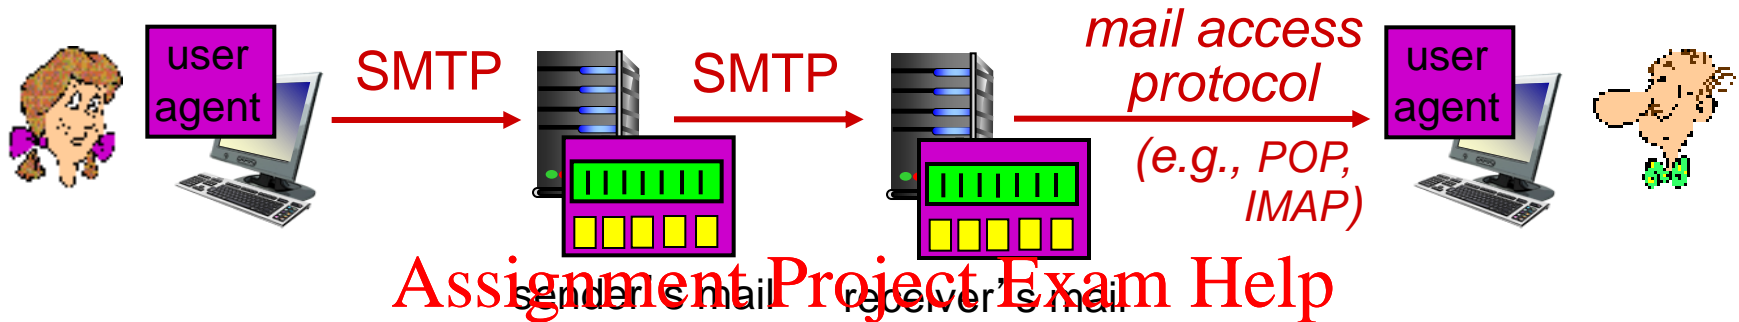

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Mail Access Protocols

- SMTP: deliver to server
- Mail access protocol: retrieval
 - POP: Post Office Protocol [RFC 1939]: authorization, download
 - IMAP: Internet Mail Access Protocol [RFC 1730]: more features, including manipulation of stored msgs on server
 - HTTP: gmail, Hotmail, Yahoo! Mail, etc.

POP3 vs IMAP

POP3

- previous example uses POP3 “download and delete” mode
 - Bob cannot read mail if he changes it
- POP3 “download-and-keep”: copies of messages on different clients
- POP3 is stateless across sessions

IMAP

- keeps all messages in one place: at server
 - allows user to organize messages in folders
 - server state
 - folders and mappings between message IDs and folder name

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Email Message Format

- **SMTP Message format**

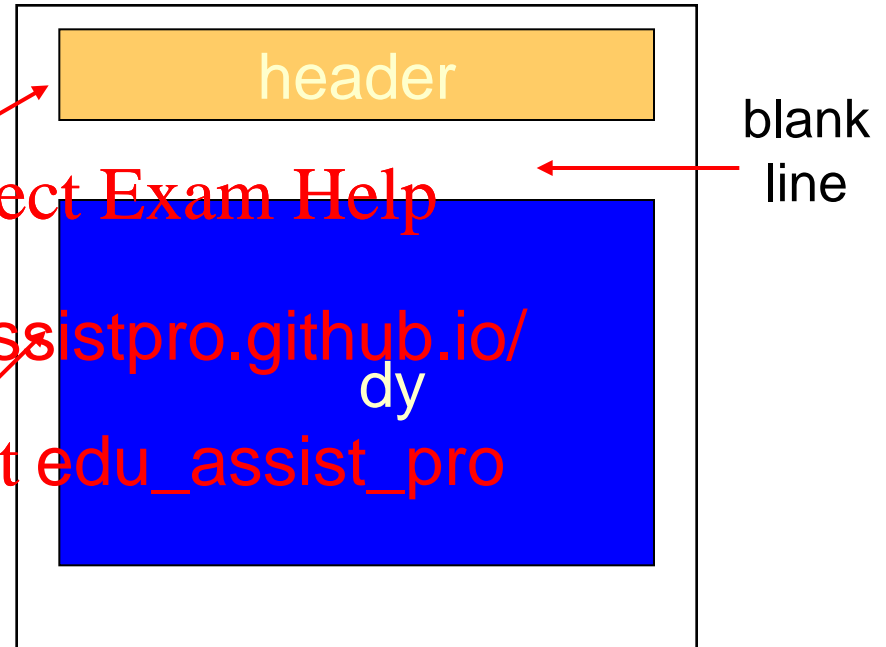

- RFC 822: standard for text message format

- **Header lines**

- Contains info about the message (e.g., to, from, subject)

- **Body Section**

- Contains the 'content of the message'
- Begins with the 'DATA' keyword
- Only uses ASCII characters

POP3 protocol

authorization phase

- **client commands:**
 - **user:** declare username
 - **pass:** password
- **server response**
 - +OK
 - -ERR

```
S: +OK POP3 server ready
C: user bob
S: +OK
C: pass hungry
S: +OK user successfully logged on
```

transaction phase

- client:**
- **list:** list message numbers
 - **retr:** retrieve message by number
 - **dele:** delete
 - **quit**

```
C: list
S
C
S
S: .
C: dele 1
C: retr 2
S: <message 1 contents>
S: .
C: dele 2
C: quit
S: +OK POP3 server signing off
```

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

MIME

- **Multipurpose Internet Mail Extension**

- A **graphic-capable mail transfer agent protocol** (to send graphical information in addition to text)
 - SMTP was designed years ago for text transfer only
- MIME software is an e-mail client
- Superimposed on SMTP, so a graphic can be represented using it, sent via SMTP (as a special attachment)
- Receiver's e-mail client then translates the MIME attachment from text back into graphical format

Telnet/SSH

- **Allows one computer to log into another computer**
 - Remote login enabling full control of the host
- **Requires account name and password**
 - Anonymou oach
- **Most popular**
 - Open source
 - Uses SSH encryption for security
- **Remote Desktop (windows)**
 - Most advanced, connecting Window-based machines, provide full access to Window interface

Instant Messaging (IM)

- One of the fastest growing Internet applications

FIGURE 2-16

How instant messaging (IM) works. LAN = local area network

Assignment Project Exam Help

- Allows us exchange

<https://eduassistpro.github.io/>

typed messages or chat with friends

Add WeChat edu_assist_pro

Videoconferencing

- Provides **real-time transmission of video and audio signals**
 - **Combined video/audio signals sent via WAN (Wide Area Network)**
 - **Desktop videoconferencing is growing (Skype, FaceTime, etc.)**
fast
<https://eduassistpro.github.io/>
Add WeChat edu_assist_pro
 - **Require a lot of network capacity thus use data compression**
 - **Most often compatibility is an issue**
-
